Question 1.

/*Implement a class Complex which represents the Complex Number data type. Implement

the following operations:

1. Constructor (including a default constructor which creates the complex number 0+0i).

2. Overloaded operator+ to add two complex numbers.

3. Overloaded operator* to multiply two complex numbers.

4. Overloaded << and >> to print and read Complex Numbers.*/

```cpp
#include<iostream>
using namespace std;
class complex
{
                float x;
                float y;
public:
    complex()
                {
                   x=0;
                   y=0;
                }

                complex operator+(complex);
                complex operator*(complex);
                friend istream &operator >>(istream &input,complex &t)
                {
                   cout<<"Enter the real part";
                   input>>t.x;
                   cout<<"Enter the imaginary part";
```

```cpp
                input>>t.y;
        }
        friend ostream &operator <<(ostream &output,complex &t)
        {
                output<<t.x<<"+"<<t.y<<"i\n";
        }

};

complex complex::operator+(complex c)
{
                complex temp;
                temp.x=x+c.x;
                temp.y=y+c.y;
                return(temp);
}

complex complex::operator*(complex c)
{
                complex temp2;
                temp2.x=(x*c.x)-(y*c.y);
                temp2.y=(y*c.x)+(x*c.y);
                return (temp2);
}

int main()
{
```

```cpp
        complex c1,c2,c3,c4;
    cout<<"Default constructor value=\n";

    cout<<c1;

                cout<<"\nEnter the 1st number\n";

                cin>>c1;

                cout<<"\nEnter the 2nd number\n";

                cin>>c2;

                c3=c1+c2;

                c4=c1*c2;

                cout<<"\nThe first number is ";

                cout<<c1;

                cout<<"\nThe second number is ";

                cout<<c2;

                cout<<"\nThe addition is ";

                cout<<c3;

                cout<<"\nThe multiplication is ";

                cout<<c4;

                return 0;

}
/*
student@student-OptiPlex-3010:~$ ./a.out

Default constructor value=

0+0i

Enter the 1st number

Enter the real part2

Enter the imaginary part4

Enter the 2nd number
```

Enter the real part4

Enter the imaginary part8

The first number is 2+4i

The second number is 4+8i

The addition is 6+12i

The multiplication is -24+32i

student@student-OptiPlex-3010:~$

Question 2.

/*Implement a class Quadratic that represents   two degree polynomials i.e., polynomials of type ax2+bx+c.

Your class will require three data member corresponding to a, b and c.

Implement the following operations:

1.A constructor(including a default constructor which creates the 0 polynomial).

2.Overloaded operator+ to add two polynomials of degree 2.

3.Overloaded << and >> to print and read polynomials.

To do this, you will need to decide what you want your input and output format to look like.

4.A function eval that computes the value of a polynomial for a given value of x.

5.A function that computes the two solutions of the equation ax 2 +bx+c=0

*/

```cpp
#include<iostream>
#include<cmath>
using namespace std;

Question 6

/*==

Assignment no : A6

Title   : Implement C++ program to write a class template to represent a generic

vector. Include following member functions:

To create the vector.

To modify the value of a given element

To multiply by a scalar value

To display the vector in the form (10,20,30,...)

CLASS   :

Batch   :

ROLL NO   :

Date   :

==*/

```cpp
#include<iostream> //header file
#include<vector>
using namespace std; //declared scope of program
void display (vector<int>&v) //function declaration
{
                for(int i=0;i<v.size();i++)
                {
                    cout<<"  "<<v[i];
                }
                cout<<" \n";
}
int main()
{
                vector<int> v;
                cout<<"\n Initial Size: "<<v.size();
                int x;
                cout<<"\n Enter The 5 Element: ";
                for(int i=0;i<5;i++)
                {
```

```cpp
            cin>>x;

            v.push_back(x);

        }

        cout<<"\n Size After Insertion: "<<v.size();

        cout<<"\n Vector Element: ";

        display(v);

        cout<<"\nVector Element After insertion of 3 at End of Vector: ";

        v.push_back(3);

        display(v);

        vector<int>::iterator itr=v.begin();

        itr=itr+3;

        v.insert(itr,9);

        cout<<"\n Content After Insertion 9 at position 3rd: ";

        display(v);

        v.erase(v.begin()+3,v.begin()+5);

        cout<<"\n After Erasing(3rd-4th position): ";

        display(v);

}

/*------------------------OUTPUT------------------------------------

gescoe@gescoe-OptiPlex-3010:~/Desktop/se$ g++ fifth.cpp

Question 9

Write a function in C++ to count and display the number of lines not starting with alphabet 'A' present in a text file "STORY.TXT".

October 19, 2018

Write a function in C++ to count and display the number of lines not starting with

alphabet 'A' present in a text file "STORY.TXT".

Example:

If the file "STORY.TXT" contains the following lines,

The roses are red.

A girl is playing there.

There is a playground.

An aeroplane is in the sky.

Numbers are not allowed in the password.

The function should display the output as 3.

```cpp
#include<iostream>
#include<fstream>
using namespace std;
int main()
{
```

```cpp
    ifstream fin;

    fin.open("Story.txt");

    char str[100];

    int count=0;

    int count1=0;

    while(!fin.eof())

    {

        fin.getline(str,100);

        if(str[0]!='A')

        {

            count++;

        }

        else if(str[0]=='A'&&str[1]==' ')

        {

            count1++;

        }

    }

    cout<<"The number of lines not starting with 'A' are:"<<count<<"\n";

    cout<<"The number of lines starting with 'A' are:"<<count1<<"\n";

    fin.close();

    return 0;

}
```

Question 10

/*Write C++ Program with base class convert declares two variables, val1 and val2,

which hold the initial and converted values, respectively. It also defines the functions

getinit( ) and getconv( ), which return the initial value and the converted value.

These elements of convert are fixed and applicable to all derived classes that will inherit convert. H

owever, the function that will actually perform the conversion, compute( ),

is a pure virtual function that must be defined by the classes derived from convert.

The specific nature of compute( ) will be determined by what type of conversion is taking place.*/

#include <iostream>

using namespace std;

```cpp
class convert {

    protected:

        double val1;

        double val2;

    public:

    convert(double i){

    val1=i;

}

double getconv()  {return val2;}

double getinit()  {return val1;}

virtual void compute ()=0;

};

  //Liters to gallons
